SUMMARY

Computer Science student concentrating in Cloud Computing and DevOps, I have skills to automate and manage scalable infrastructure using AWS, Terraform, Docker, and Jenkins. I have the exposure to building multi-tier AWS architectures and deployment pipelines as well as printing network security measures through VPCs and bastion hosts and familiar with implementing Infrastructure as Code (IaC).

EDUCATION

Bennett University
Bachelor of Science in Computer Science - CGPA: 9.0

Greater Noida, Uttar Pradesh
September 2023 – May 2027

SKILLS

- **Programming & Scripting**: Proficient in Python, C++, HTML, CSS, MySQL and Linux Shell Scripting.
- **Cloud & Infrastructure as Code**: Hands-on experience with AWS, Azure, CI/CD, Terraform, Jenkins and Docker.
- **Tools**: Skilled in Firebase, Supabase, and FlutterFlow.

PROJECTS

- **Terraform Multi-tier AWS Architecture**
 - Designed and automated multi-tier AWS infrastructures using Terraform for consistent, reliable, and repeatable deployments.
 - Created parameterized modules to allow for security and scalability in different environments, including dev, staging, and prod.
 - Fluent deployment pipeline facilitating the creation of rock-solid, secure foundations on which newly developed cloud applications could rely, with an uptime of 99.9 % for all services.
 - **Technologies: Terraform, AWS**
- **ClassMate – Student Management Application**
 - Created an easy-to-use student manage application UI to streamline academic workflow operations.
 - Connected Supabase real-time backend to have real-time consistency and synchronization of data across devices.
 - **Technologies: FlutterFlow, Supabase, Firebase**
- **Path-based Routing**
 - Created URL-based routing architecture to manage application traffic and streamline request flow.
 - Increased system reliability and resource utilization by routing requests efficiently across various backend services.
 - **Technologies: AWS (Application Load Balancer)**
- **Bastion Host Setup**
 - Set up a bastion host as a gateway for restricted and guaranteed access to private AWS subnets.
 - The network security is increased to prevent direct connections and enforce centralized authentication.
 - This thus reduces about 90% risk of unauthorized entrance.
 - **Technologies: AWS (EC2, VPC, Security Groups)**
- **Route 53 Web Hosting**
 - Managed deployment of scalable web hosting with domain-based DNS management using AWS Route 53 with full effect and reliability.
 - Distributes traffic for ensuring the highest availability with lowest downtime and maintains the automated failover mechanism.
 - **Technologies: AWS Route 53**
